

Stripe Field Guide

Stripe fails quietly. A webhook endpoint stops delivering and the payments still succeed, so revenue looks normal while everything that should happen after a payment stops. Every script here is read only.

1 fixes, each one a written note with diagrams and a small Python and Node.js script that finds the problem and repairs it. All 1 have a script in the public repo.

Before you run anything. Every script starts in a dry run: it reports what it would change and writes nothing. Read that output first, then set `DRY_RUN=false` when you are satisfied it has understood your data.

All 14 repos: github.com/allanninal

The fixes

1 a webhook endpoint sits disabled after days of retries

Orders stopped being fulfilled on a Tuesday. Nothing changed in your code that week, nothing appears in your application logs, and Stripe still shows the payments as succeeded. Nothing is arriving at all — Stripe gave up on the endpoint and stopped trying.
